PLANNING, DESIGN & CONSTRUCTION

Planning and Design

Planning and Design Services provides interior and landscape design, space planning and square footage reports, building floor plans, maps, and utility locates to the university community.
The University Planner is responsible for the university's facilities master planning, preparation of architectural and landscape architectural guidelines and standards, architectural and landscape architectural design review.

Digs and excavations require services of the campus Utilities Locator, contacted through the Arkansas One-Call network at 811 or 1-800-482-8998.

Customers can also request access to online floor plan drawings, construction documents and square footage reports through the Space Manager.

Construction Services

Construction Services provides a full range of planning, project development and construction services offered through the University Planner/Landscape Architect and Construction Management Services. All renovations, modifications or work done to university buildings and grounds must be performed by or in cooperation with Facilities Management in advance.

Projects include roofing repairs or replacement, correction of structural defects, replacement or repair of installed utilities and distribution systems, and other high cost items that cannot be funded in the operating budget. A preventive maintenance program inspects facility equipment and systems and schedules routine service. Periodic tests of elevators, fire protection systems, boilers, and pressure vessels are performed in accordance with applicable codes and regulations.
